FROGS AND TOADS PROBLEM

Camp treatment Report:

Toad and frogs eggs strand sampling from the open drain channel. Water stagnation in the channel is the camps main source of new frogs and toads incubation especially with the intense heat

Massive eggs incubating in the drain. They simply anchor on anything and upon going through the life cycle migrate to the hidden spaces below the accommodation units. From here they mate and occasionally move out to look for food and partners for breeding.

Mega Consult Limited team treating for control of toads and frogs beneath the accommodation units at Mariakani camp.

Termite shelter tubes at the catering unit in mashariki camp. If this problem is not attended, soon the structural damage will result in massive replacement of the makuti roofing and the timber that holds the structures

Termite shelter tube in Marwan's office.

This is a serious problem in the offing.

Witness a previous termite anthill, surveyed, treated and lastly reviewed on 21/2/2016 by Mega Consult Ltd. Allow us to propose immediate treatment. (See next slide)

TREATMENT RECOMMENDATION

Treatment of termites for the Makuti catering unit: action points & guarantee:

- ✓ Drilling into areas where structural pests have been identified
- ✓ Treatment of timber for termite control
- ✓ Protection of the entire catering and food service area from future attacks from termites (perimeter excavation)
- ✓ Treatment provides 10 years guarantee for all areas treated.

Costs for treatment at Mashariki camp (Catering unit only):

Total cost ksh. 160,000 + 16% VAT
(work involves drilling and excavation hence the costs)

Further Proposal:

Consider treatment also of termite ant hills in the area where bushes have been cleared – Mashariki camp.

Mariakani camp: Increase the number of rodent bait stations to atleast 60 from the current 40 pieces. During this treatment, please take note two bait stations were missing (Number 31 and 32 – refer to bait map)
